Identification & Dimension

General rule of the height, width and length of a section or unit can be determined with the module concept:

A. 39CQEC 0608~2333

(1) Unit Height = Height Module×100+90+100(base)

(2) Unit Width = Width Module×100+90

Example : 39CQEC 0711

07 Height Module

Unit Height: $7 \times 100 + 90 + 100$ (base) =890mm

11 Width Module

Unit Width: $11 \times 100 + 90 = 1190$ mm

B. 39CQEC 2532~3438

31 Height Module

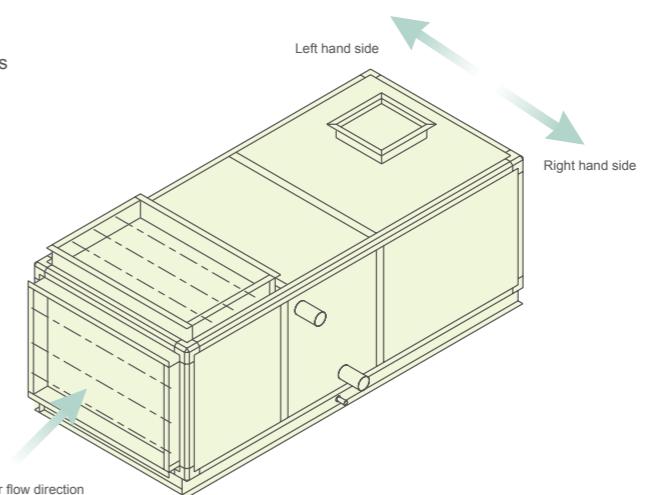

Unit Height: $31 \times 100 + 90 + 200$ (base) =3390mm

32 Width Module

Unit Module: $32 \times 100 + 90 = 3290$ mm

Unit orientation

Unit Orientation is determined by the location of the inlet and outlet pipes of the coil and the access panel while facing unit in the direction of air flow.

Air volume

39CQEC

2,000-100,000m³/h

Excellent airtightness

The casing is made up of panels, frame and sealing strips. New casing structure of the unit avoids that any of the interior support member is exposed and ensures smooth internal surface, easy for cleaning and maintenance. New type of sealing strips between the frame and the panels, and careful sealing design to all access panels and locations passing-through pipes ensure excellent air tightness of the units.

Thermal bridge free

Carrier unique frame design enables pentapost and interpost covered by panel to prevent exposing in treated air, so the thermal bridge at posts is avoided. Each junction is subjected to special heat insulation treatment to prevent the thermal bridge effect. New design of screw also prevents the occurring of thermal bridge at screws, contributes to better casing performance.

Optimal thermal insulation

The middle layer of the unit panels is a 50mm thick PU foam with light weight, good rigidity, and thermal conductivity. Moreover, special insulation treatment is conducted at the inner parts of the frame and the middle frame strips to eliminate thermal transmission through the casing.

Access and serviceability design

Integrated control system

Factory assemble integrated control system with touch screen display saves installation and maintenance cost and ensures optimal operation.

Modular design convenient to select

The width, height and length of the unit are proportionally increased with 100mm as module. Each air volume corresponds with a certain unit type. Standard modular products make modeling and manufacturing faster and more convenient.

Double skin panel construction

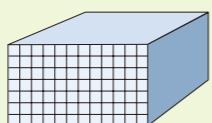

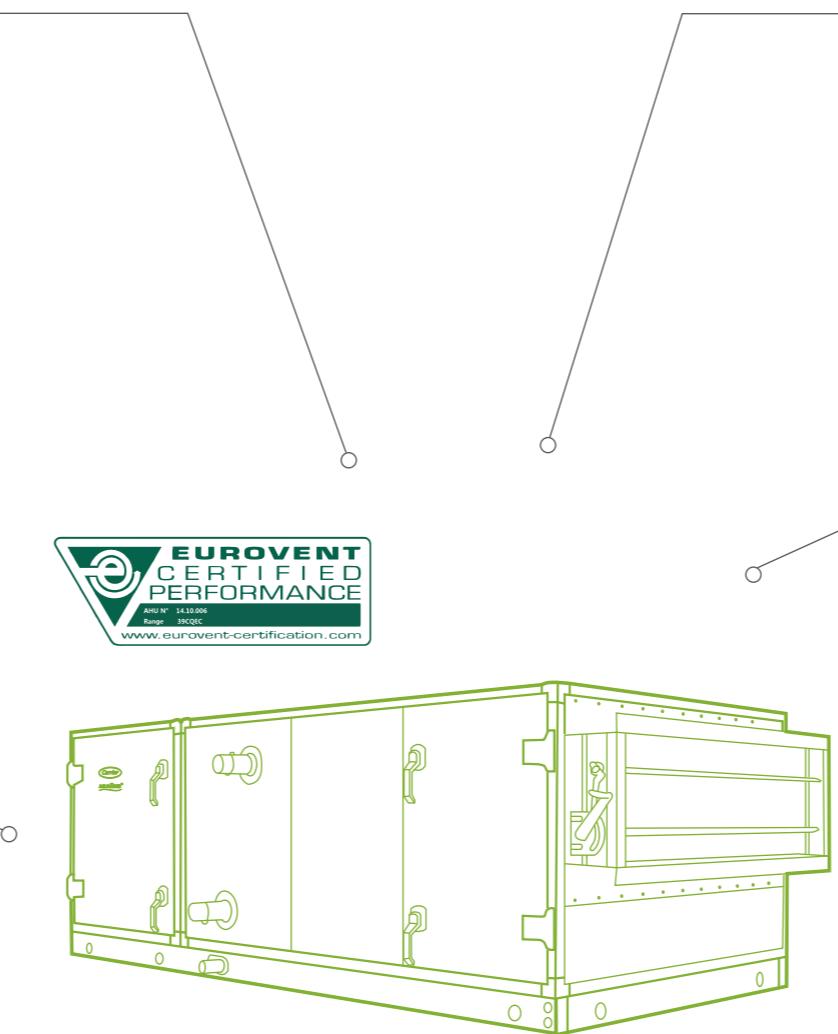

Pre-painted panel as standard configuration of external panel, high durability (HDP) painted panel can be optional, ensure good rust preventive performance. Galvanized steel is standard for interior panel, and stainless steel sheet is also available.

Unit base

Each section has a base, which enhances the strength of the whole unit, reduces vibration, and make it easy to transport and assemble.

Easy maintenance

All basic component parts are standard and interchangeable with competitive prices. The unit is designed to have removable panels on its one side, and the access panels are arranged in the necessary components, providing convenience for repair and maintenance of the fan, coil and filter. The coil is installed on the guide rail inside the drain pan, enabling easy maintenance, cleaning and removal.

Various filters available to meet different needs

A complete line of filters is available, the levels of filters are ranging from primary filters (Panel type, filter class up to G4), to medium filters (Bag type, filter class up to F9), and to high filters(filter class up to H13). Some special filters such as activated-carbon filters, cartridge filters and electrostatic filters can also be provided.

High efficiency filter

Bag filter

Panel filter

Flexible application

Heat wheels

Optimized design, high efficiency and vibration-free operation

The fan impeller and pulley are statically and dynamically balanced, and the whole fan is calibrated through the operational vibration testing, making the fan to operate stably and smoothly. With the fan and motor assembly mounted on a common base with shock absorber and the fan outlet isolated from the casing by a flexible connection and completely separated from moving parts, the vibration is effectively isolated. Moreover, the forward or backward impeller may be selected according to the air pressure and volume.

Hot and cold water coils designed according to international standard

Fins are the "dual sine-wave" form and mechanically bonded with copper tubes, realizing excellent heat transfer efficiency. Hydrophilic aluminum foils may also be utilized to achieve better heat transfer performance. The standard coil header is constructed of steel and can also be customized with copper.

Headers have drain and vent connections, so coil is drainable and has no air trapping circuits. The water in the coil must be discharged in winter to avoid the frost crack of the coil.

If the coil face air velocity is higher than 2.5m/s, a drift eliminator can be installed on the back of the coil to effectively isolate moisture in air.

Corrugated damper flexible to adjust

With manual or electric mode available, the corrugated linkage damper can be opened flexibly, and can also add an electric controller as required.

Heat recovery options

To improve indoor air quality is generally accomplished by introducing ventilation from outdoors. The air must be conditioned to match the indoor space. Carrier energy saving solution offer options for energy-recovery wheels. These proven technologies economically transfer energy between the exhaust-air and fresh-air paths, reducing the cost of conditioning the fresh air.

Efficient and durable PM2.5 solution

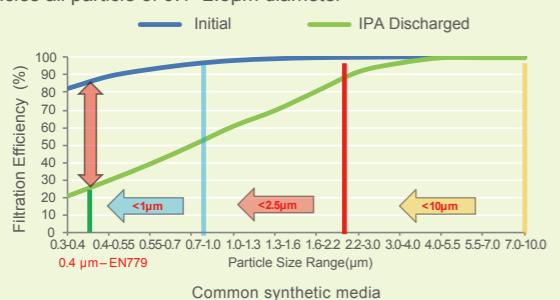

Related researches show that indoor and outdoor pollutants are the most important contributory factor of diseases related to the environment. Air contaminants : particles, sulphur dioxide, ozone and nitrogen dioxide have serious effects on health particles, especially for particles below 2.5 μm . Clear connection between increased pollution levels with particles below 2.5 μm and increased mortality caused by cardiovascular and respiratory illness.

Carrier new efficient and durable PM2.5 filter using the latest nano filtration media, responds to criteria of new EN779 standard (F7 – F9 range), high efficiently filter out PM2.5 and other air pollutants, providing you with a clean and healthy indoor environment.

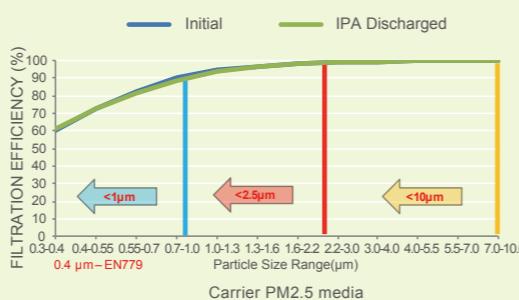

Efficient and stable filtration performance, PM2.5 removal efficiency up to 98.5% *

Carrier PM2.5 filter using the latest nano filtration media, purely mechanical filtration principle, Media is not charged – no charge dissipation and media performance remains intact for PM 2.5 μm particles. Common synthetic filter with electrostatic charged media, static electricity continue to disappear during use, filtration efficiency will drop sharply, so it need to be replaced frequently.*

*Indicates all particle of 0.1~2.5 μm diameter

Common synthetic media

Carrier PM2.5 media

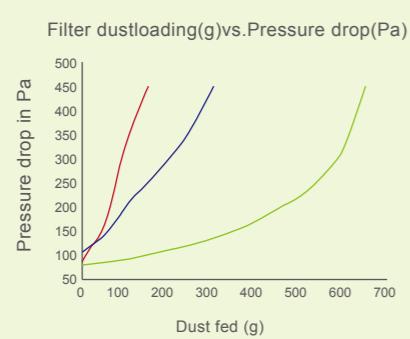

More than double the dust load capacity – longer life

Combining fine fiber and filtration surface, fine fiber with greatly increased surface area and double the dust load capacity in the media. Compared with normal synthesis filter, PM2.5 filter has longer lifetime, reducing the routine maintenance costs.

Lower energy consumption, superior energy classification according to Eurovent 4/11

Under the same efficiency level, the initial pressure drop of Carrier new PM2.5 filter is 35% lower than that of glass mat. Lower pressure drop, lower energy consumption.

Quick selection

Model	Coil Face	Air Volume (m ³ /h)			Inside Dimension of Damper (mm*mm)	Dimensions(mm)

23	39CQEC2832	5380	7.24	<160	160~320	320~480
24	39CQEC3132	5380	8.15	<175	175~350	350~525
25	39CQEC3438	6250	10.56	<225	225~450	450~675

Note : 1. Star connection is used in the wiring of electric heaters. Multi-group control is available, in which the capacity for each group is generally 30kW or less.

The power supply is 3-phase 380V.

2. Minimum air velocity is 2m/s.

3. 3M module holds maximum of 3 row heater.

4. Capacity exceeding 3 row should choose two separated heaters in 6M module section.

Standard components (0608~2333)

No.	Unit Section	Diagram	Section Length (M: Module)	Remark
1	Return/Mixing Chamber		(0608~0912) 5M (0913~1317) 6M (1418~1621) 8M (1822~2025) 9M (2125~2333) 11M	
2	Bag Filter		6M	Access section is recommended at upstream
3	Combined Filter		6M	Access section is recommended at upstream
4	Cooling Coil		5M or 6M	The section length is 5M with drift eliminator and 6M without drift eliminator
5	Heating Coil		3M	May be installed together with the cooling coil if this cooling coil does not include a film humidifier and a drift eliminator
6	Steam Heating Coil		3M	
7	Electric Heating Coil		3M	
8	Steam Humidifier		6M	
9	Film Humidifier		3M	May be installed directly in the coils and drain pan, no additional space needed
10	Spray Humidifier		6M	Could share the drift eliminator with cooling coil when it is installed next the coil.
11	Fan		Refer to fan table	Four discharge configurations available
12	Combined Mixing Chamber		(0608~0913) 10M (0914~1825) 12M (2025~2333) 18M	
13	Attenuator		6M(1 Level) 12M(2 Level)	Access section is recommended at upstream

Ordering Information

- Unit Direction: Along the airflow direction, left unit refers to units with water inlet and outlet of the coils and the access door on the left side , vice versa.
- If units installed at outdoors or in corrosive environment, shall consult factory before ordering so as to ensure unit meet with application requirements.
- Requirements of the unit basement: The length and width of the unit basement should be designed according to the unit, and the basement should be horizontally flat and higher than the ground for ease of installation of the condensate trap.

- Calculated Value: $H = \text{Negative pressure at the drain hole of the condensate plate } Pa/10(\text{mm})$, $X > 1/2H$
- Empirical Value: when negative pressure < 1,000 Pa, $H=100\text{mm}$, $X=70\text{mm}$
- Notice when connecting the coil: The designed working pressure of both cooling and heating coil is 1.6mPa.
- For fresh air units, when the temperature drops below 0 , preheating devices should be required to prevent frost cracking of the coils inside the units.
- The supply air temperature of the unit should not be higher than 80 (when heating), requests as such shall be brought forward when ordering, so that high temperature bearings and motors could be adopted.
- The unit outlet and duct should be connected with flexible connection.
- Residual water should be drained of the coil if the temperature falls below the freezing point when the unit is shut down. Put antifreeze in the coil in case there's still residual water.
- For electric heating,
 - Electrical components and cable configuration shall be wires according to the power of electric heater.
 - Wiring shall be carried out in line with the electric heater wiring diagram.
 - The temperature relay signal of the electric heater shall be sent to the electric heating controller, to assure automatic power off when the temperature is too high in the unit.
 - The controller of electric heater shall interlock control fan and electric heater, to keep the electric heater module powered off when the fan stops.
- PTC thermistor has been installed in fan motor, should be connected with protective relay, to achieve motor overheating protection function. If customer need more information about how to choose protective relay, please contact THC for technical support.
